Thanapat Aupprathumwipanon

Software Engineer

Bangkok, Thailand | +66 99-009-0809 | thanapat.aupp@gmail.com | github.com/miramsalp | personal-website-miramsalp.vercel.app

Computer Engineering student at Chulalongkorn University shipping production full-stack systems in React, NestJS and TypeScript to thousands of real users, and Python/FastAPI services putting LLM retrieval behind a government API contract.

Education

B.Eng. Computer Engineering, Chulalongkorn University — *expected May 2027, GPA 3.53*

Experience

Software Engineer Intern — Skooldio

Feb – Jul 2026

Wise Mentoring Ship — cross-university mentorship platform · React, NestJS, TypeScript

- Top committer on the team. Built features across the NestJS API, React web app and admin back-office for a platform with **2,000+ mentors and mentees**: sign-up, mentee requests, mentor handling and dashboards.
- Wrote **70+ API endpoints** with clean architecture and Swagger, set up CI/CD, and built LINE notifications on GCP Cloud Tasks.

Software Engineer (Part-time) — Wise

Aug 2026 – Present

Wise Mentoring Ship — continued ownership · React, NestJS, TypeScript

- Kept on by Wise after the Skooldio contract to work across the whole platform, front end and back end.
- Led the move of **2,000+ accounts**, with their mentoring history and files, from the old system to the new platform: planned it, wrote the scripts and ran the live migration.
- Build new features end to end, from the API to the React web app and back-office, and fix production issues.

Frontend Developer — ISD, Chulalongkorn University

Jul 2026

Student-organization registration platforms — First Date & RubpuenKaomai 2026 · React

- Built the registration flow, landing page and edit-profile UI and integrated the APIs behind them, for freshman-welcome events used by **5,000+ students** at peak sign-up.

Projects

RAG-GIS Heritage Impact System — capstone project

An API that writes Thai heritage-impact reports from GIS analysis results, for ONEP, a government agency. · FastAPI · RAG · SSE

- Built `/analysis`, the endpoint ONEP's GIS system calls: defined the request schema from their spec, turned the results into a RAG query and prompt, and returned the report.
- Site counts and legal references are filled in by code, so the LLM only writes the summary and cannot get the numbers wrong.
- Timeouts and empty answers return an error instead of a blank report, so ONEP can retry.
- Added streaming responses (SSE) to the chat API.

Tax Tracker

A capital-gains tax calculator for Thai investors trading foreign equities. · TypeScript · Vite · In-browser PDF parsing

- Reads broker PDFs in the browser and calculates FIFO capital gains per stock, checked against monthly statements, with unit tests for the parser and FIFO engine.
- No server or database, so trade data never leaves the machine. Unknown documents are rejected instead of guessed, since the numbers go into a tax return.

Skills

Languages	TypeScript, Python, JavaScript, C++
Frontend	React, Tailwind CSS, Vite
Backend & Data	NestJS, FastAPI, Node.js, PostgreSQL, Firestore, Redis, RAG
Infrastructure	GCP, AWS, Docker, GitHub Actions
